

# TotalControl

Providing a secure and reliable wireless network (WiFi) is no longer optional for live meetings and events. The same way you expect your hotel room to have hot water in the shower, your attendees and exhibitors expect you to have some level of WiFi on the event floor. This concession alone can cause a decline in attendance and repeat exhibitors - just imagine going to an Internet of Things (IoT) conference only for there to be no internet available for product demos #WiFiFail

**TotalControl** WiFi from DataPoint puts you in complete control of the user experience, while providing multiple ways for you to turn the WiFi into a profit center instead of a burdening expense on your event budget.

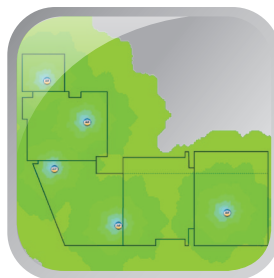

In addition to helping you capitalize on your private network, DataPoint will act as your internet division helping you source bandwidth, design a network specific to your show's location and needs, while providing on-site technical assistance and real-time network monitoring. We'll even give you the network stats and user data after the event to help you calculate the ROI!

If you're planning an event in the next twelve months give us call today and let DataPoint help you take **TotalControl** of your event WiFi.
